

2 to 64 synchronous & asynchronous serial links for Compact PCI bus

ACKSYS, the French designer and manufacturer of telecommunications solutions for advanced industrial applications, is introducing a new range of intelligent programmable communication boards for the Compact PCI frame.

MCX Compact PCI boards are genuine onboard "communication PCs" which give you a wide choice of communication interfaces to meet the most extensive range of requirements for applications demanding maximum performance:

WAN protocol analysis and simulation, standard or special protocol management, real-time communication, laptop download stations, event dating, line monitoring, high-speed communication ...

Designed to last, the MCX-CPCI range was developed for the toughest operating environments.

Thanks to total functional compatibility with the MCX models for ISA and PCI buses, industries where these boards have been in use for going on 10 years now will be able to maximise their return on software investment while taking advantage of the robustness and reliability of the Compact PCI frame.
